

OpusClip Scheduling Panel Audit Notes

Reference-based UI/UX breakdown using provided screenshots • 2025-12-22

Purpose

Capture what OpusClip’s scheduling experience does well (layout, interaction patterns, clarity) so we can audit our Scheduler UI and close gaps without losing data detail.

Source Screens Included

Screenshots captured from OpusClip (month calendar + scheduling flow modals) were used as the only reference source for this document.

Figure 1 — Month calendar grid with post cards (Posted vs Scheduled)

Figure 2 — “Select project” modal: clip grid + scheduled count badges + upload option

Figure 3 — Clip detail modal: video preview + AI scoring (Hook/Flow/Engagement/Trend) + actions

Figure 4 — Copy/regeneration + account selection + final schedule bar (date/time/timezone)

Observed UX Principles (Why it feels clean)

- High-contrast hierarchy: titles and primary actions pop; secondary metadata stays muted.
- Progressive disclosure: calendar cards show just enough; deeper editing happens in modals.
- Single-purpose screens: each modal step has one primary job (pick clip → review → write copy → schedule).
- Consistent component language: same card style, pill style, and spacing across calendar and modals.
- Clear state signaling: Posted vs Scheduled is obvious via a pill + timestamp placement.

1) Month Calendar View — Layout & Patterns

What's visible in the month grid (Figure 1):

- A strict month grid with large, quiet day cells (minimal borders, low-noise background).
- Post cards anchored at the bottom of a day cell; empty space above reduces clutter.
- Each post card shows: account identity (avatar + handle), status pill (Posted/Scheduled), scheduled time, and a short title line.
- Dense days use stacking while maintaining consistent card height and spacing.

Patterns worth copying:

- Keep day labels lightweight but readable; highlight current day subtly.
- Keep card titles short; treat the title as the hero line, and time as supporting metadata.
- Use a single, consistent status pill shape for all states (Scheduled/Posted/Failed/etc.).

2) Calendar Card Information Architecture

Minimal card that still communicates everything important:

- Identity: avatar + handle (top-left).
- State: status pill (top-right).
- Time: clock icon + time (secondary line).
- Title: one-line summary (truncated).

Suggested acceptance criteria for our cards (month/week/day):

- Card remains readable at glance at 80–90% zoom on a laptop.
- Title truncates with ellipsis; never overlaps badges or metadata.
- Time is present for Scheduled content, and Posted content shows the published time or relative time.
- Card supports hover affordances (edit, duplicate, delete) without changing layout height.

3) Scheduling Flow — Step Model (from screenshots)

OpusClip appears to implement a guided, multi-step flow:

1. Pick a clip (Select project modal)
2. Review clip quality (detail modal with AI scoring)
3. Generate/edit caption + select accounts/platforms
4. Pick schedule date/time/timezone and confirm schedule

Why this is clean: each step limits choices to a focused set, reducing cognitive load.

4) “Select Project” Clip Grid Modal

- Top tabs: Projects / Likes (simple content sourcing).
- Secondary action: “Upload own video” (clear escape hatch).
- Clip grid cards show: duration, thumbnail, and a small badge indicating how many times it has been scheduled.
- Scrolling grid keeps the user in the selection context (no page navigation).

Ideas to adopt in our product:

- Add a scheduled-count badge for any media asset to prevent accidental overuse (fatigue control).
- Include lightweight filtering: by project, by platform compatibility, by already-used status.
- Show duration and a quick preview on hover (optional).

5) Clip Detail Modal — Quality signals before scheduling

- Large video preview on left with clear play action and timecode.
- Right panel shows an overall score (e.g., 99/100) and breakdown tabs (Hook, Flow, Engagement, Trend).

- Short, direct explanation text—keeps the user oriented on what to fix.
- Primary CTA: “Select Clip” with a secondary info button (“Scheduled times”).

Why this matters for our workflow:

- It creates a ‘vetted creative’ step before scheduling or ads.
- It allows the system to attach structured evaluation metrics to the media asset (good for experiments and narrative decisions).

6) Copy + Account Selection + Final Schedule Confirmation

- Left rail for account selection (multi-account, multi-platform).
- Caption editor is central, with an attached media preview to the right.
- Regenerate copy controls are grouped and labeled by dimension (Tone, Format, Mimic, Hashtag).
- Bottom sticky schedule bar: date/time + timezone, plus a single primary action button (Schedule).

Patterns to adopt:

- Use a sticky bottom action bar for multi-step scheduling so the CTA never ‘disappears’.
- Keep caption editor + media preview together to avoid context switching.
- Group AI controls by intent (tone/format/etc.) rather than presenting a big prompt box.

7) Audit Checklist — Compare OpusClip vs Our Scheduler

Use this checklist while reviewing our Month/Week/Day views and schedule flow:

- Month grid: day labels readable; today subtly highlighted; grid doesn’t feel ‘boxed in’.
- Cards: title is hero; status pill consistent; time always visible; no text collisions at small widths.
- Empty states: clear ‘add/schedule’ affordance; doesn’t require hunting for the + button.
- Progressive disclosure: card stays minimal; details live in modal/drawer.
- Multi-step flow: clip selection – review – copy/accounts – schedule confirm is coherent and linear.
- Sticky CTA: Schedule/Save buttons stay anchored and easy to reach.
- Fatigue guardrails: show scheduled count per asset; warn on overuse.
- Timezone handling: visible and editable at schedule time; persists per user/account.
- Keyboard and focus: modals trap focus; Esc closes; Tab order makes sense.
- Error states: save failures show inline; do not silently fail; retry available.

8) Concrete UI Changes We Can Make (Low effort, high impact)

- Reorder calendar card typography: title on top, handle/time below, pill aligned right.
- Add per-asset scheduled count badges in media library and clip picker.
- Convert scheduling into a guided stepper with a sticky bottom action bar.
- Add ‘Details’ modal that includes performance/quality scores (even if basic at first).
- Standardize spacing tokens and reduce competing legends/controls in the scheduler header.

Appendix: Data fields OpusClip implies in this flow

- Media asset: id, thumbnail, duration, project, scheduled_count
- Post draft: caption text, hashtags, platform targets, selected accounts

- Schedule: datetime, timezone, status (scheduled/posted/failed), publish result metadata
- Quality metrics: overall score + dimension scores (hook/flow/engagement/trend) + explanation text
